

CHANGES IN GECS 4.21 PACKAGES

GECS version 4.21 started shipping February 21st, 2012.

You can find the date of the last GECS package installed by looking in the file named PKGDATE.TXT located in your GECS program directory.

The following lists major changes to this package. Back end code optimization and/or documentation changes are not always listed.

Known Issues

It has been reported that when using Semantics Anti Virus Software with GECS, you may get an error stating that GECS Workstation Setup program (c40setup.exe) is quarantined as a virus. There is no virus in this program. We are working with Semantics to get this resolved.

Changes in System Build: 4.21.413 Administrator Build: 4.21.023

A change was made to the way GECS components are updated. This change was made to resolve a rare issue where the System Manager record was over written with agent information.

Event Definitions that have been modified in older versions of GECS can now be converted to newer versions during an upgrade.

The job view lists now display the maximum rows filter on the bottom right corner of the screen.

Changes in System Build: 4.21.389 Administrator Build: 4.21.022

A modification was made to rescheduling with a custom calendar using non-business days and day of the week scheduling.

GECS Users configured with security, "Submission Rights = Approval Required" can no longer "Release Hold" for jobs with an "On Hold" status.
