

WHAT'S NEW IN VERSION 4.10

- **Job Search** – A prompt has been added at the top of job views that allows users to distill view results and find specific jobs more easily.
- **Improved Job Views** – Job views have been enhanced to allow for much more granularity. All of the new v4.01 statuses/results have been added as view property selections. This allows users to easily create job views such as 'failed jobs' or 'late jobs' with complete accuracy.
- **Enhanced Job History Report** – Job history now includes all audits, job runs and events associated with the job in chronological order. The report can also be exported via XML or CSV formats.
- **Metadata** – New fields have been added at the batch/job level for metadata tags. Metadata tags allow for a free form method to group jobs in job views. A new filter has been added to job view properties to support metadata tags.
- **Run Now Option for Jobs** – Jobs can now be forced to 'run now' from the right click menu in GECS Administrator. The 'Ignore All Dependencies' selection will ignore all GECS job triggers including time to force start a job on demand.
- **GECS Administrator Data Export** – Data can now be exported from Administrator into either XML or CSV format.
- **Event 'Assigned to' Filter** – GECS Event views can now be filtered for events assigned to a specific GECS user.
- **GECS Variable Name Lengthened** – GECS Variable names have been increased from 8 to 48 characters to allow them to be more descriptive.

Continued on Next Page

- **Unable to Reschedule Job Result** – Jobs that are unable to reschedule on completion no longer get a status of 'Unable to Reschedule'. The result will reflect how the job actually ran. An 'Unable to Reschedule' event will continue to be generated.
- **XML Backup and Restore** – Backup and Restore utilities will now work with files in XML format.
- **XML WRK Files** – Support for XML as a WRK file format.
- **Data Dumped in XML Format** – The GECSDUMP, GECSLDUM, GECSEDUM and GECSADUM utilities will now export data in XML format.
- **New Job, Event and Alert Column** – A new internally used datetime column titled 'added' has been added to the gecsjobs, gecsjobhistory, gecsjobarchive, gecsevents and gecsalerts table to help tie events and alerts to specific runs of jobs.
